# Introduction

**Python** is an interpreted, high-level, general-purpose programming language. Created by Guido van Rossum and first released in 1991, Python's design philosophy emphasizes code readability with its notable use of significant whitespace. Its language constructs and object-oriented approach aim to help programmers write clear, logical code for small and large scale objects.

## Departmental Store

This project is done using python programming language. This is a project containing details of products available in "Rajasthan Store" and their price comparison graphs, this project also contains income and profit details of the store in past 5 years and also their comparison graphs along with them.

The program can be modified and can be used for other companies. The work interface is very simple and suits any type of users. It's data can be modified and viewed as per the user's convenience.

# Source Code

```
#!/usr/bin/env python
# coding: utf-8
